

Regularization

Chandranath Adak

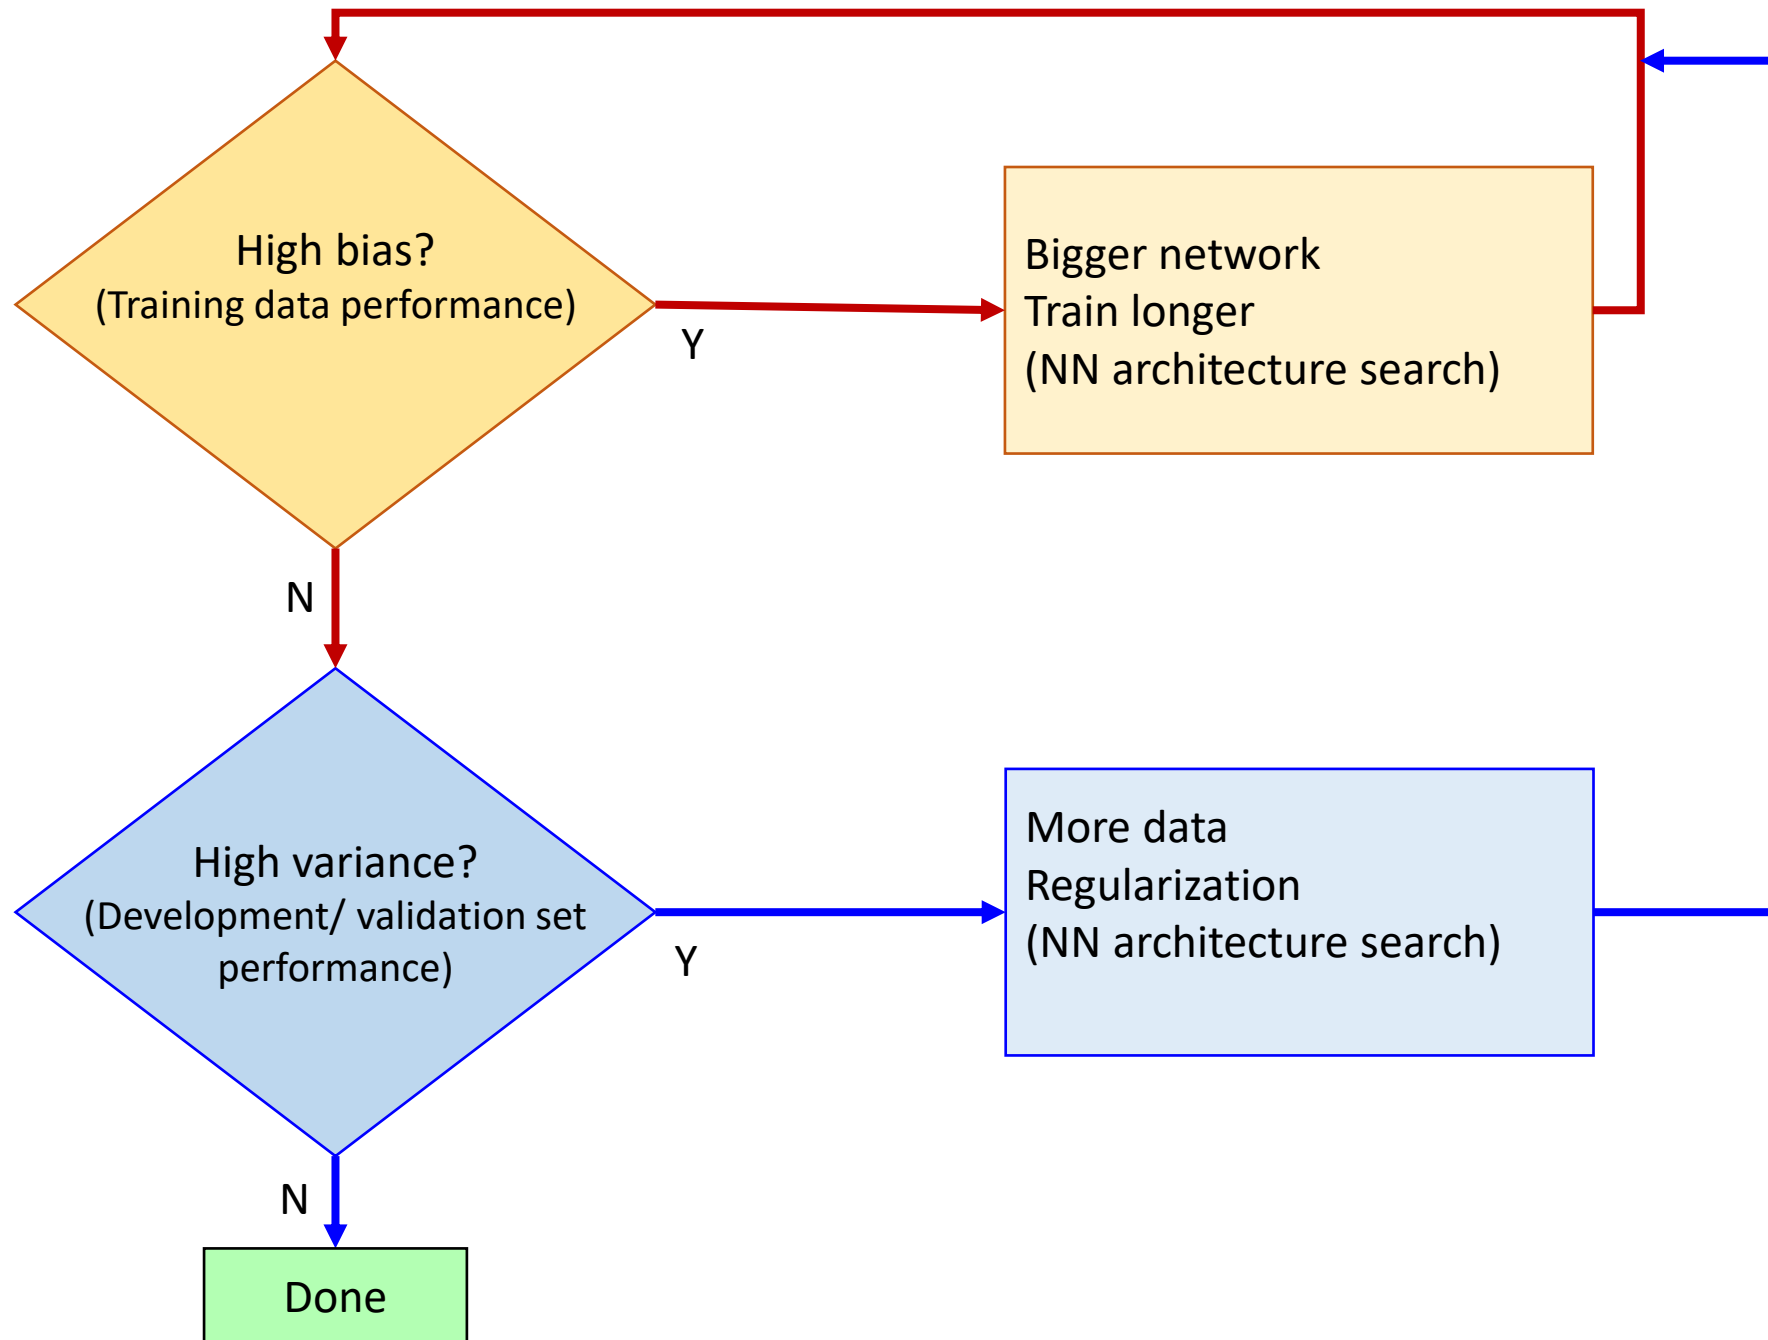

Dept. of CSE, IIT Patna

High Bias vs. High Variance

Training error	1%	15%	15%	0.5%
Testing error	11%	16%	30%	1%
Infer	High variance	High bias	High bias & High variance	Low bias & Low variance

Assumption: Human/ optimal (Bayes’) error $\approx 0\%$

Regularization

$$J(w, b) = \frac{1}{m} \sum_{i=1}^m \mathcal{L}(\hat{y}^{(i)}, y^{(i)}) + \frac{\lambda}{2m} \|w\|^2 + \frac{\lambda}{2m} \|b\|^2$$

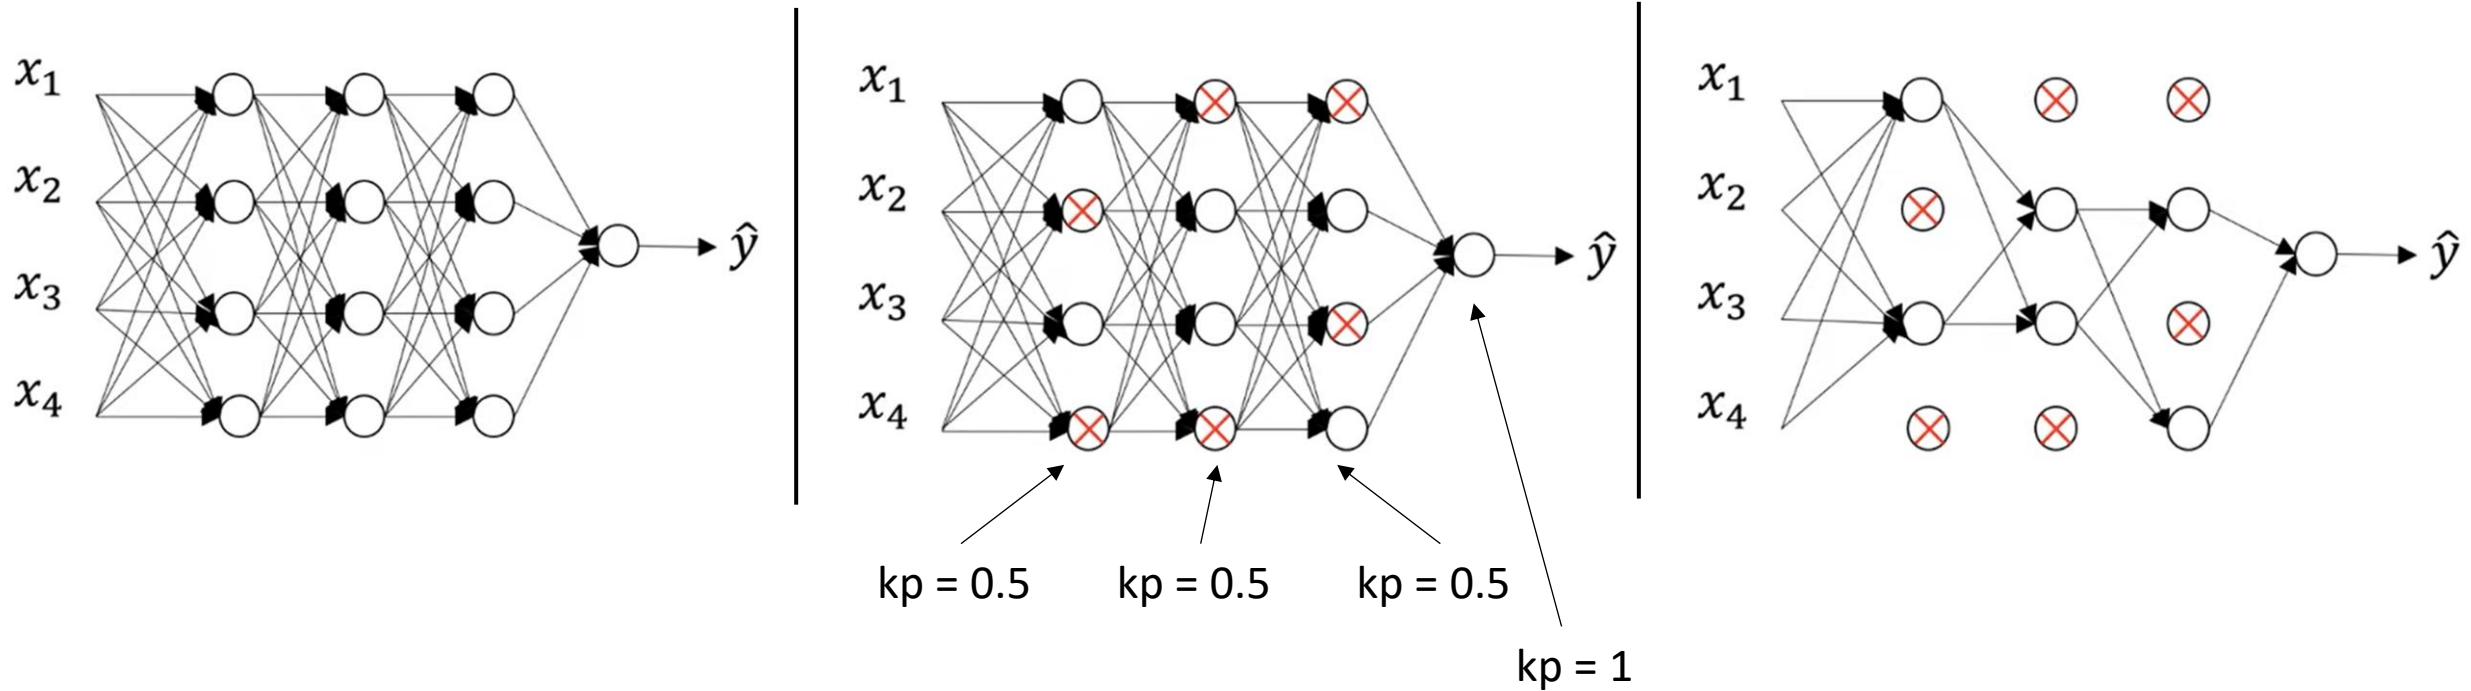

$$\text{L2 regularization} = \|w\|^2 = \sum_{j=1}^{n_x} w_j^2 = w^T w$$

$$\text{L1 regularization} = \|w\|_1 = \sum_{j=1}^{n_x} |w_j|$$

λ increases: underfitting

λ decreases: overfitting

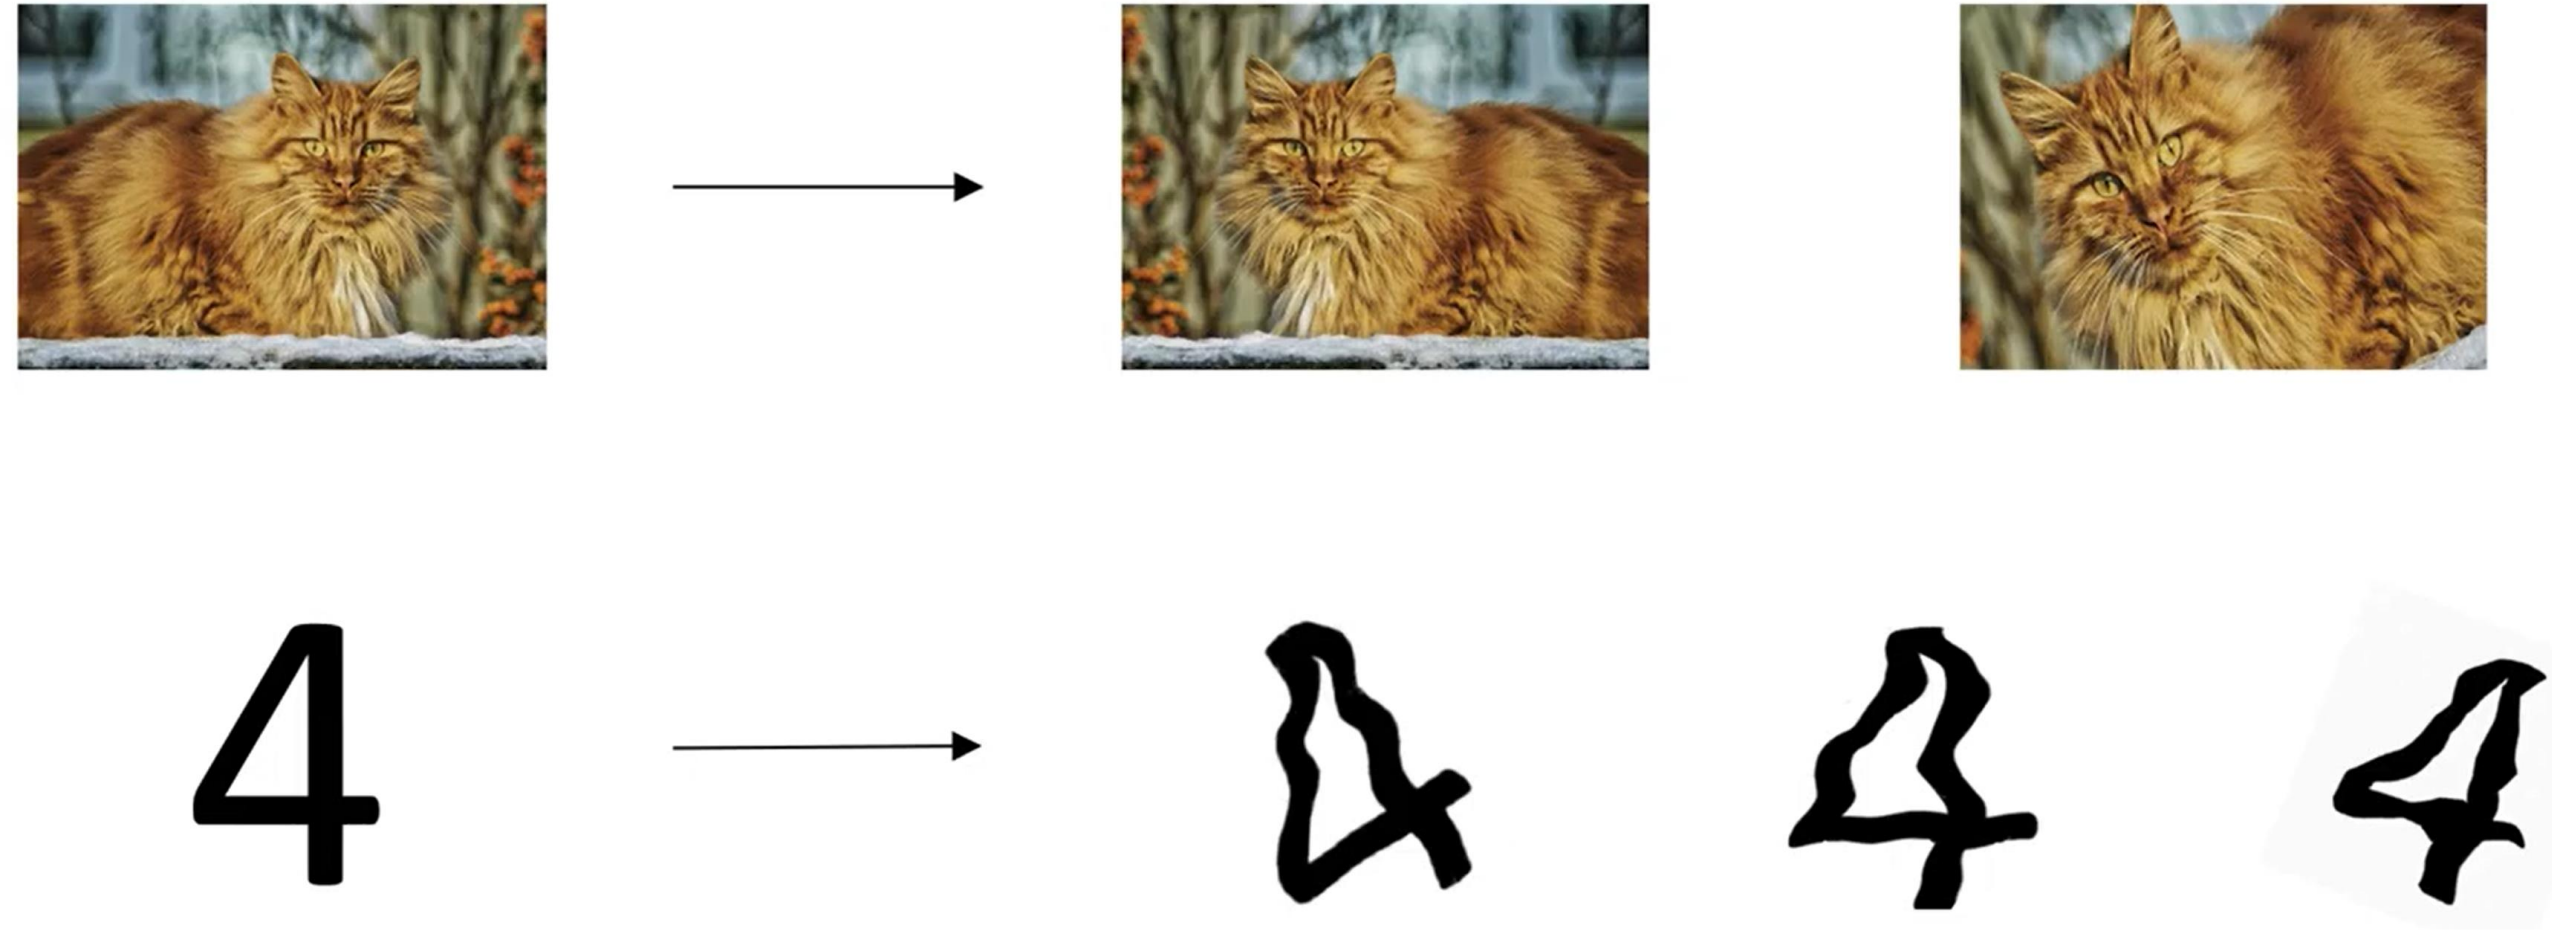

Dropout Regularization

keep_prob (kp) = 1 ➡ No Dropout

Intuition: Can't rely on any one set of features, so have to spread-out weights

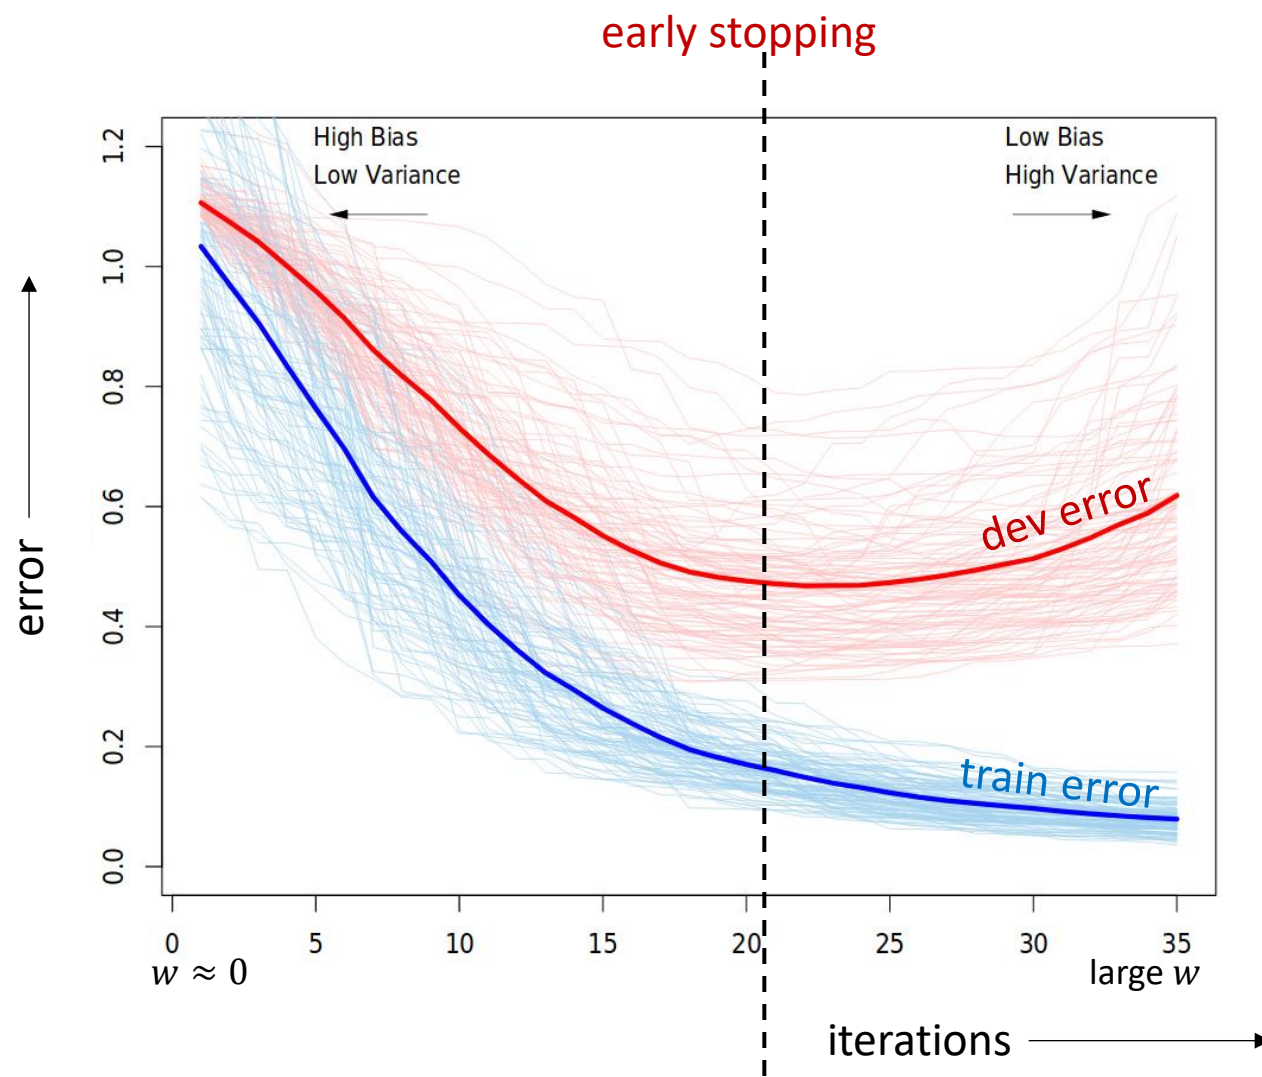

Data Augmentation

Data Augmentation

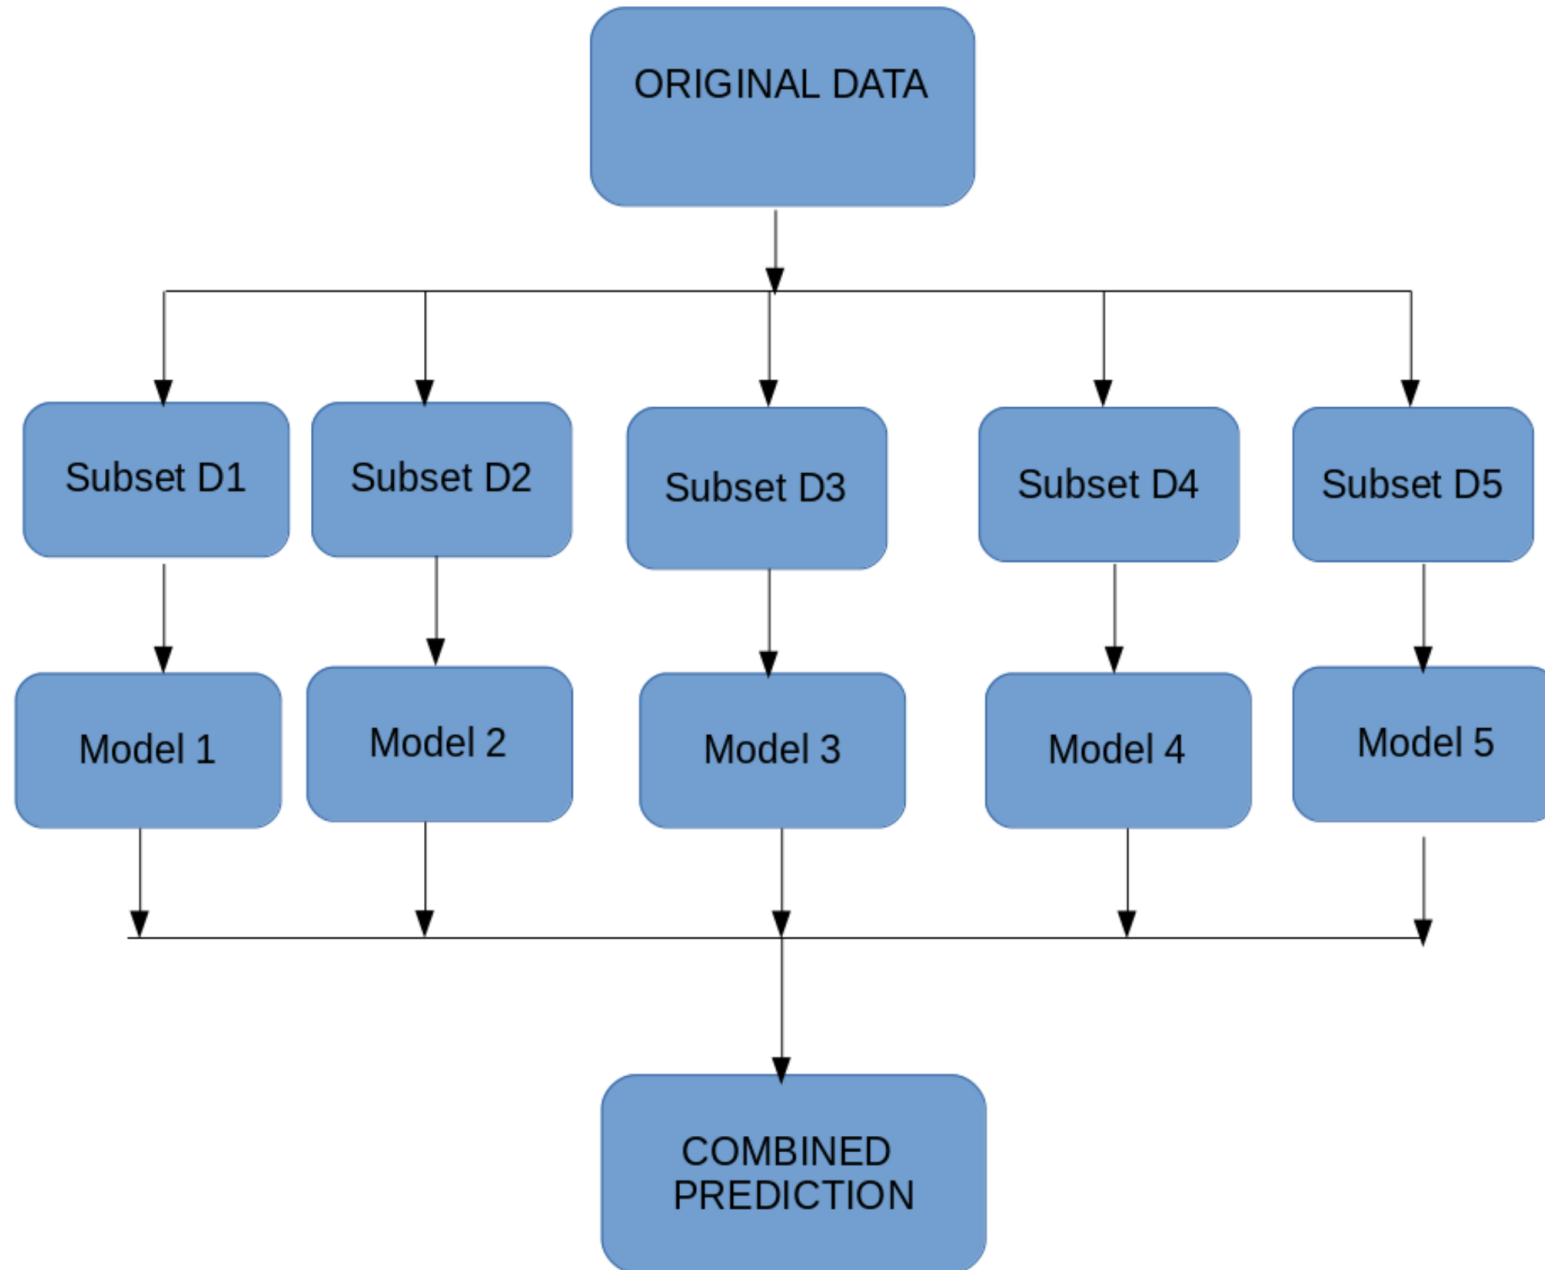

Early Stopping

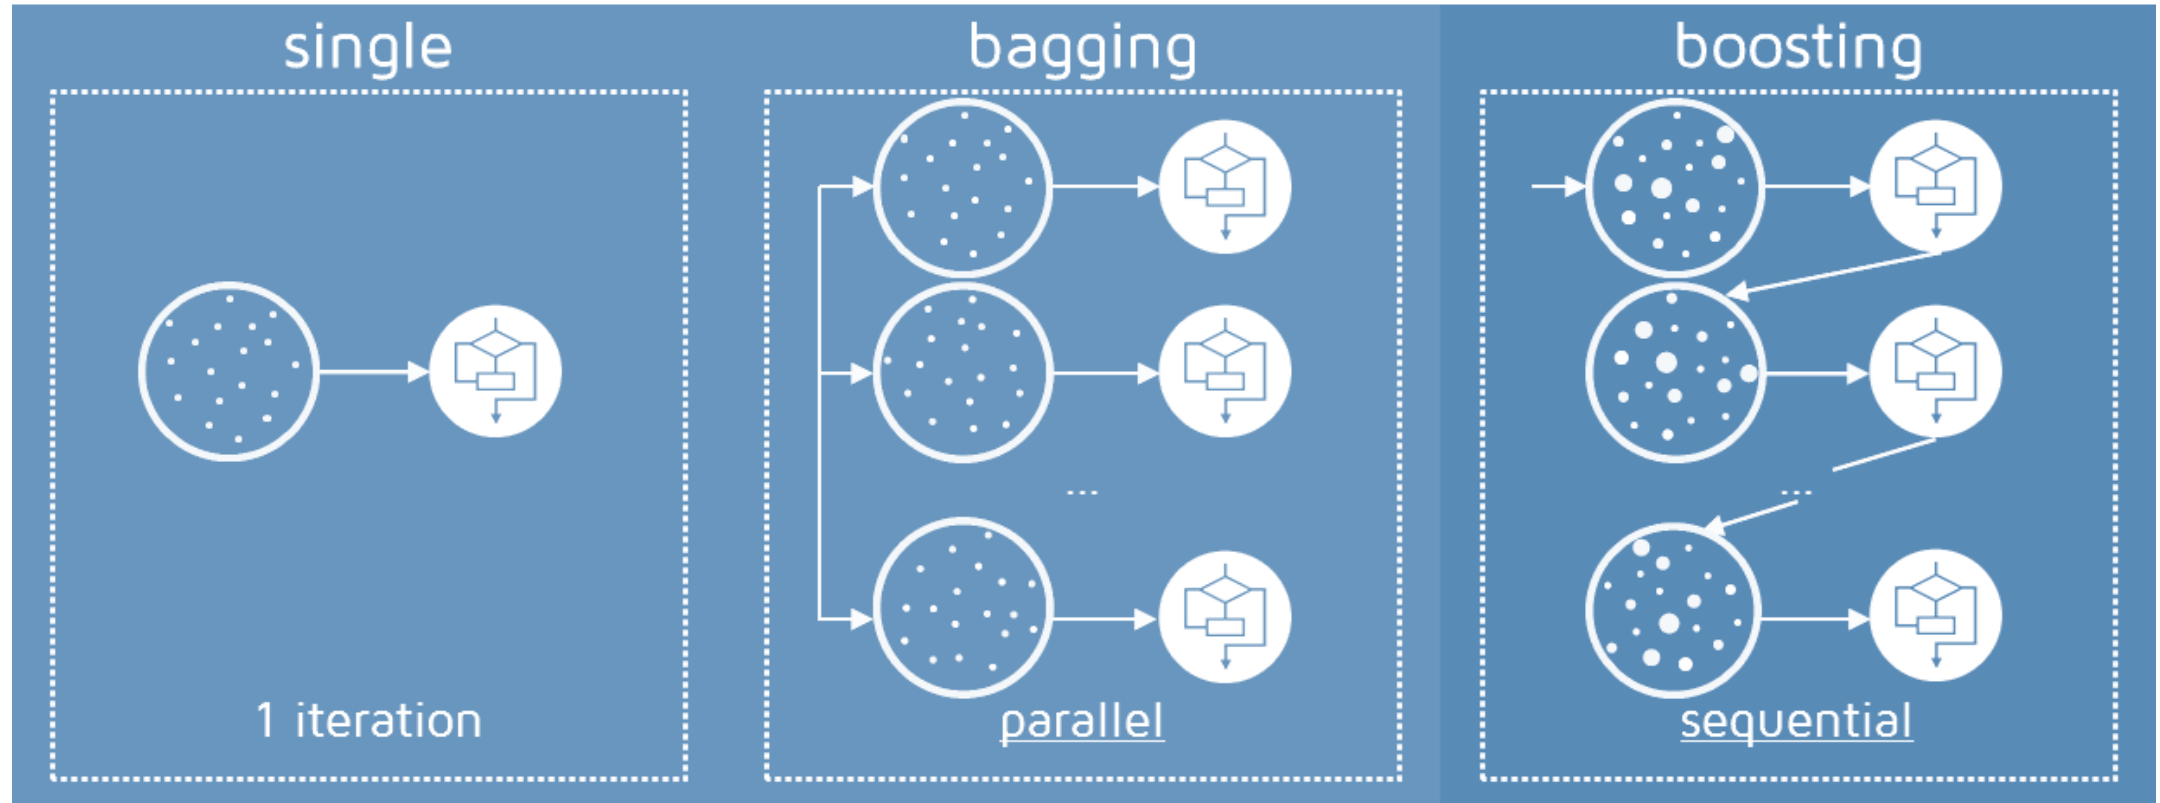

Ensemble for Generalization

- Train on random subsets of the full training data. This procedure is known as **bagging**.
- Train networks with different architectures (e.g. different numbers of layers or units, or different choice of activation function).
- Use entirely different models or learning algorithms.

Bagging

Bagging vs. Boosting

Bagging tries to solve the over-fitting problem.
Boosting tries to reduce bias.

Thank You!
