## 1. Bitwise Tree

Given a tree of  $tree\_nodes$  vertices numbered from 1 to  $tree\_nodes$ , each edge is associated with some weight, given by array  $tree\_weight$ .  
There are  $q$  queries in the form of a 2D array,  $queries$ , where each element consists of two integers (say  $u$  and  $v$ ). For each query, compute the sums of the bitwise XOR, the bitwise AND, and the bitwise OR of the weights of the edges on the path from  $u$  to  $v$ .  
Return the answers to each query as an array of integers.

**Example**

1  
 $tree\_nodes = 3$   
 $tree\_from = [1, 3]$   
 $tree\_to = [2, 2]$   
 $tree\_weight = [2, 3]$   
 $q = 2$   
 $queries = [[1, 3], [2, 3]]$

Edges of the tree in the form  $(u, v, w)$  are  $[[1, 2, 2], [2, 3]]$ .

- For  $queries[0]$ ,  $u = 1, v = 3$ , XOR of weights =  $2 \wedge 3 = 1$ , AND of weights =  $2 \& 3 = 2$ , OR of weights =  $2 | 3 = 3$ . Hence the answer to this query is  $1 + 2 + 3 = 6$ .
- For  $queries[1]$ ,  $u = 2, v = 3$ , XOR of weights =  $3$ , AND of weights =  $3$ , OR of weights =  $3$ . Hence the answer to this query is  $3 + 3 + 3 = 9$ .

Return the array [6, 9].

- For  $queries[0]$ ,  $u = 1, v = 3$ , XOR of weights =  $2 \wedge 3 = 1$ , AND of weights =  $2 \& 3 = 2$ , OR of weights =  $2 | 3 = 3$ . Hence the answer to this query is  $1 + 2 + 3 = 6$ .
- For  $queries[1]$ ,  $u = 2, v = 3$ , XOR of weights =  $3$ , AND of weights =  $3$ , OR of weights =  $3$ . Hence the answer to this query is  $3 + 3 + 3 = 9$ .

Return the array [6, 9].

**Function Description**  
Complete the function `getPathXORAND` in the editor below.

`getPathXORAND` has the following parameters:

```
int tree_nodes: the number of nodes in the tree
int tree_from[tree_edges]: each tree_from[i] is one end of edge i
int tree_to[tree_edges]: each tree_to[i] is one end of edge i
int tree_weight[tree_nodes]: the weights of the edges
int queries[q][2]: a 2D array of queries
```

**Returns**  
`int[q]`: the answers to the queries

**Constraints**

- $1 \leq tree\_nodes \leq 10^5$
- $1 \leq q \leq 10^5$
- $1 \leq queries[i][0], queries[i][1], tree\_from[i], tree\_to[i] \leq n$
- $1 \leq tree\_weight[i] \leq 2^{20}$
- It is guaranteed that lengths of arrays  $tree\_from$ ,  $tree\_to$ ,  $tree\_weight$  equal  $tree\_nodes - 1$ .

Given an array `arr` of  $n$  positive integers, the following operation can be performed any number of times. Use a 1-based index for the array.

- Choose any  $i$  such that  $2 \leq i \leq n$ .
- Choose any  $x$  such that  $1 \leq x \leq arr[i]$
- Set  $arr[i-1] \rightarrow arr[i-1] + x$
- Set  $arr[i] \rightarrow arr[i] - x$

Minimize the maximum value of `arr` using the operation and return the value.

**Example**

$n = 4$

$arr = [1, 5, 7, 6]$

Assuming 1-based indexing.

One optimal sequences is:

- Operation 1: choose  $i = 3$ ,  $x = 4$  (note that  $x \leq arr[3]$ , i.e.  $4 \leq 7$ ).
  - Replace  $arr[1]$  with  $arr[1] + x$  or  $5 + 4 = 9$
  - Replace  $arr[2]$  with  $arr[2] - x$  or  $7 - 4 = 3$
  - The array is now [1, 9, 3, 6] (maximum = 9)
- Operation 2:  $i = 2$ ,  $x = 4$ 
  - Replace  $arr[2-1]$  with  $1 + 4 = 5$
  - Replace  $arr[2]$  with  $9 - 4 = 5$
  - The array is now [5, 5, 3, 6] (maximum = 6)
- Operation 3:  $i = 4$ ,  $x = 1$ , the resulting array is [5, 5, 4, 5] (maximum = 5)

The minimum possible value of `max(arr)` is 5 after operation 3.

**Function Description**  
Complete the function `getMaximum` in the editor below.

`getMaximum` has the following parameter:

`int arr[n]:` an array of integers

**Returns**

`int:` the minimum maximum value possible

**Constraints**

- $1 \leq n \leq 10^5$
- $1 \leq arr[i] \leq 10^9$
